Harlan J. Berk, Ltd. has presented an innovation in antiquities and numismatics for some time now. The system is simple. When you want an antiquity or coin in the sale, just bid the estimated price by phone, fax, web site, email or post. We will send you the antiquity or coin immediately. No waiting for the closing of the sale. Any and all antiquities or coins not sold before the closing date will be sent to the highest bidder on May 10, 2011.

EXAMPLE—You bid estimate on an item valued at \$100.00 and if your bid is the 1st to reach us, you will receive the item immediately. If on the other hand, you bid \$75.00 on the same item and are still the high bidder at the end of the sale, the item will be mailed to you after the closing date, May 10, 2011.

If you are ever in the area, stop in to see us! Of course, it's best to call first. **Harlan J. Berk, Ltd. reserves the right to refuse any bids.**

- large ears and tusks. This symbol surely relates to the victory of Antiochus III over barbarians in 269 BC. The Galatian tribes crossed the Hellespont in winter of 278/7. Some of them served briefly as mercenaries in the army of Nicomedes of Bithynia, but then they were set loose to ravage Asia Minor. The three tribes divided Asia Minor into raiding districts. The Trocmi took the Hellespontine coast, the Tolistobogii claimed Aeolis and Ionia, and the Tectosages drew the inland. Places known to have been raided or threatened/extorted include Cyzicus (278/7), the sanctuary at Didyma (277/6), Priene and Erythrae (270s), Thyatira, Laodicea on the Lycus, and perhaps Limyra or other places in Lycia. In 269 BC, Antiochus I drove the barbarians out of Asia Minor. Antiochus I was honored as Soter (Savior) by the Ionian League and at Bargylia in Caria. The "Elephant Victory" was commemorated by terracotta statuettes at Myrina and by a poet from Magnesia ad Sipylum. Obverse has surface porosity from 10 to 12 o'clock. Obv: Bust of Apollo l. showing back and shoulders, wielding thunderbolt in r. hand. Rx: Minerva in quadriga r., C. LICINIVS LF / MACER in exergue, an almost inverted overstrike over another die of the same type: the legend in exergue from the first strike, with slightly different shapes and positioning of the two lines of letters of the legend, is visible almost upside down at the upper right. A most unusual Republican instance of a reverse struck twice with two different but contemporaneous reverse dies, a phenomenon that is considerably commoner on Roman imperial sestertii and middle bronzes, and that suggests, as Colin Kraay deduced in conversation with C. Clay c. 1972, that those two reverse dies were being applied alternately and at rapid tempo at the same anvil die, occasionally producing such overstrikes when the completed coin was not removed promptly enough from the obverse die. Excellent evidence for an otherwise unsuspected coin production technique, and very rarely observed on Republican denarii. Good VF.....1000

 151. **SEPTIMIUS SEVERVS**; 193-211 AD. Rome, 206 AD. Denarius, 2.78g. BM-343, C-253 (60 Fr.), RIC-274 (R2). Obv: SEVERVS PIVS AVG Head laureate r. Rx: LAETITIA TEMPORVM The spina of the Circus Maximus decorated as a ship facing l., with the turning posts at its prow and stern, a sail mounted on the central obelisk, and the spina's other monuments visible in between; above the ship, four quadrigas racing l.; below, seven animals: an ostrich at l. and bear (indistinct on this specimen) at r., between them a lion and a lioness chasing a wild ass and a panther attacking a bison. Rare: only three specimens in Reka

Devnia hoard. This famous type commemorates the chariot races and animal hunt that took place on the seventh and final day of Severus' Saecular Games in 204 AD, as described in the inscriptional acts of those games which were found in Rome in the 1870s and 1930s, and also in the text of Dio Cassius, tacked on to his description of Severus' Decennalian Games of 202 AD by his Byzantine epitomator as we can now see. The games consisted of chariot races, indicated by the racing quadrigas in the coin type, and then a hunt of 700 beasts, 100 each of "lions, lionesses, panthers, bears, bison, wild asses, ostriches", which were released in large groups from a receptacle shaped like a boat. As C. Clay was the first to observe, the seven kinds of animals named by both Dio and the inscriptional acts are also depicted in the coin type: on good specimens, especially the aureus BMC pl. 34.4, the ostrich and the bear are clear, the lion has a mane, the ass has long ears, the bison has horns and a hump. Two large felines remain, of which we may suppose that the one accompanying the lion is the lioness and the one attacking the bison is the panther. On our denarius as on that in the BM (pl. 35.19), however, the panther attacking the bison has been omitted and, instead, the ass running from the lion and lioness and looking back at them has been given a second head with antelope-like horns, as though to represent two animals overlapping each other. This is one of the more spectacular types found on Roman denarii. aEF/EF.4250

Two Ancient Imitations

160. **ELAGABALUS, ANCIENT IMITATION:** 218-222 AD, Denarius, 3.65g. cf. BM-275, cf. C-15, cf. RIC-187. Obv: ANTONINVS PIVS FEL AVG Bust laureate, draped, cuirassed r. Rx: CON - COR - DIA around, NITIT in exergue (backwards N or M, and upside down T for L), two standards topped by wreaths flanked by two legionary eagles on vexilla. The "barbarous" style and poor engraving of some letters (notably, A is consistently rendered as Δ) reveals these denarii of Elagabalus and others of Julia Soaemias found with them to be ancient imitations, not products of the official mints that struck the prototypes. Also indicative of an unofficial issue is the wide variation of weight, ranging from 2.91g to 3.66g in the sample we obtained. It is not possible to say with certainty which tribe or group might have struck these imitations. They may well originate within the borders of ancient Dacia however, a last, late manifestation of the centuries-old tradition of imitative coinage in Dacia. Mint State.350
161. **JULIA SOAEMIAS, ANCIENT IMITATION:** Denarius, 3.26g. RIC-248, BM p. 539 f (ancient forgery). Obv: IVLIA SOAEMIAS AVGVSTA Bust draped r. Rx: AES - TA (sic) Vesta, veiled, seated l. holding ladle and transverse scepter. The "barbarous" style and poor engraving of some letters (notably, A is consistently rendered as Δ, V in VESTA is upside down, and T has an "extra" crossbar at its bottom) reveals these denarii of Julia Soaemias and others of Elagabalus found with them to be ancient imitations, not products of the official mints that struck the prototypes. The present coin of Julia Soaemias is correctly identified in the BM catalogue as a hybrid with a reverse of Julia Domna, although the authors of RIC accept it without comment as an official type of Soaemias. Obv: IMP C P C REGALIANVS AVG Bust radiate, draped right, the facial features are those of Caracalla from the undertype. Rx: PROVIDENTIA AVGG Annona standing left holding wheat ears over modius on ground and cornucopia, copied from the similar PROVIDENTIA AVG type of Severus Alexander. Extremely rare. R. Göbl, *Regalian und Dryantilla*, Vienna 1970, could locate only 26 surviving antoniniani of Regalian. Five of those coins had the PROVIDENTIA AVGG reverse type, all coming from the same pair of dies as our coin. Like all other coins of Regalian and Dryantilla, ours too is struck over a denarius of an earlier emperor, namely a denarius of Caracalla with obverse legend ANTONINVS PIVS AVG BRIT, reverse MARTI PROPVGNATORI, Mars advancing left holding spear and trophy (RIC 150). On the obverse, the neck, chin, ear, and radiate crown of the portrait are of Regalian, but the nose, eye, and forehead are remnants of Caracalla's portrait from the undertype. Four letters of the original obverse legend can also be made out: the S of [ANTONINVS] between the two uppermost spikes of Regalian's radiate crown, and the lower halves of RIT from [BJRIT], just above the surviving neck of Caracalla's portrait in the field below Regalian's chin. On the reverse, substantial remnants of the figure of Mars from the undertype intermingle with Regalian's Annona: Mars' legs, body, face, spear before, flying cloak and trophy behind can all be made out. The final three letters of the original reverse legend, ORI of [PROPVGNAT]ORI, can also be seen beneath the VGG of Regalian's AVGG. This is one of the few Regalian antoniniani with the complete name of the usurper. Overstruck as usual. Possibly the finest known. EF.18000

Obv: POSTVMVS - AV - G Radiate bust left, holding club over r. shoulder, lion's head on l. shoulder, strap across bare chest. Rx: IOVI - S - TATORI Jupiter standing l., head r., holding scepter and thunderbolt. Ex Marchand Collection; purchased from a private collection in France in 2010. Of the 12,991 antoniniani of Postumus in the Cunetio hoard, only nine had obverses depicting the emperor as Hercules, and those nine coins had two different reverse types than our coin. A remarkable and rare bust type. EF.2500

After the reduction of the Bagratid dynasty in Armenia by Byzantium and the occupation of the Bagratid capital of Ani, a number of Armenia nobles opted to leave Armenia proper rather than submit to rule from Constantinople. Many moved south into Cilicia, where other Armenian families had long been settled. One of these lords, Roupen I, was able to found an Armenian kingdom that would last for almost 300 years. The present coin is an example of the initial rare coinage of the new dynasty, struck during the reign of Roupen or his immediate successors. These were the first purely Armenian coins issued anywhere for over 1000 years. Rare and important, much sought after. VF.2000

So-called larnax with four feet and six projecting attachments for carrying. On each of the sides, a squid with four tentacles arranged in loops—this is the iconic image of the Minoan culture. On each end, decorative pairs of semicircles. Within, on the bottom, three cross-struts. Numerous faults in the walls from the firing process. An important piece, of museum quality. An important piece, of museum quality. Interestingly the Swiss doctor who owned this for many years stored wood for her fireplace in it. 267. **ARCHAIC LACONIAN KOUROS**, ca. 650-600 BC The statuette has a beautiful greenish black weathering layer with areas of reddish brown metal (probably cuprite), which are particularly evident along the right side of the body. Patches of green incrustation (malachite?) overlay the black layer. The surface condition makes it evident that the figure is ancient and has not been over-cleaned. There

is some damage to the right knee, where a piece may have flaked off in antiquity. The statuette is otherwise intact. Bronze, solid-cast. weight, 1 pound 3.1 ounces. The statuette is one of the earliest figures to present the "kouros" format, so important for Archaic Greek sculpture, but it is old fashioned enough to be considered among Gisela Richer's "forerunners" of the type.[1] The kouros format is, of course, a nude, young man standing with his hands at his sides and one foot slightly advanced. The absence of a beard and (usually) of pubic hair creates the impression of youth, and often the figures may have been intended to represent youths on the threshold of puberty, but it is clear that many were also adults. Pubic hair and a moustache survive in paint on one stone kouros.[2] and pubic hair was shown in relief in some of the later examples.[3] This figure is arguably a boy. Not only does he lack beard and pubic hair, but also he is only 6.3 heads high, a proportion that appropriate for an adolescent.[4] He is, however, quite slim. The youth advances his left foot, and his forearms bend forward slightly, with fists tightly clenched.

The youth's head is uncouth by the standards of the sixth century. The large, bulging eyes are placed closely together high on the head. The eyes are bordered by very fine lids, and their strongly rounded shapes are emphasized by concentric eyebrows. The nose is rather long and its tip somewhat bulbous. The mouth is little more than a short, straight cut, bordered with equally straight, doughy lips. The face projects an image of ingenuous intensity. The cheekbones are scarcely hinted at by an almost imperceptible swelling. In profile, the forehead continues into the nose in a long project, diagonal line. The chin is sharply pointed. The ears are defined by wiry ridges that form a kind of beta pattern (reversed in the left ear). The hair arrangement is very unusual, being combed straight back to a long flat tail that comes to a point between the shoulder blades. Fine, carefully executed incisions texture the hair. The torso is defined in simple terms and is schematic almost to the point of being geometric. The shoulders have a rectilinear silhouette, and the chest is almost prismatic, without definition of pectorals, collarbones, nipples, or navel, most of which appear in the vast majority of kouros. Only the youth's legs have real muscular articulation, with V shapes setting off the kneecap. In profile, his buttocks project emphatically, and his thighs are thick and powerful.

Many aspects of this figure find their best parallels in the first half of the seventh century BCE. Fully round eyes placed close together and short, straight mouths appear in a bronze bowl attachment of ca. 700 in Samos,[5] the Mantiklos Apollo, now in Boston, and the standing female found with him in Boeotia, now in the Walters Art Museum.[6] Huge eyes with very similar shapes appear in on a relief pithos and a terracotta plaque of this time. [7] Also similar are the features of a hammered bronze sheet with the head of a female wearing a polos crown in Olympia. The shapes of her eyes and eyebrows, the close placement of her eyes, her short mouth with straight lips, and even her beta-patterned ears are comparable. The relief at Olympia has been attributed to a Laconian workshop, but another, even more primitive repoussé mask with some of these characteristics has been excavated there. The similar typology suggests a local tradition.[8] The prismatic forms of the bronze youth's chest can be paralleled by one of the first known kouros in marble, a torso on Delos.[9] The statuette's square shoulders can be paralleled in Mantiklos' Apollo, an ivory girl of about 630 BCE from Athens.[10] and a bronze charioteer of ca. 650 in Olympia.[11] Most of these seventh century figures lack the prominent cheekbones of sixth century kouros, and the Olympia charioteer has beta-patterned ears. Articulated kneecaps are found in some early figures, such as the Olympia charioteer and a ram-carrier from Crete of about 620 BCE.[12] One of the most interesting parallels among the forerunners of the kouros format is a bronze statue from Dreros, Crete in the Heraklion museum, datable in the first half of the seventh century and perhaps even close to 700 BCE.[13] The statue has the large, very rounded eyes, the arched eyebrows, and the simple mouth of our statuette. He also has a relatively long, broad nose. The most striking parallel, however, is the hair arrangement. The Dreros statue has the same long flat tail of hair coming to a point between the shoulder blades as our bronze statuette. This hairstyle is virtually unparalleled in Early Greek art. Only remote similarities can be found in sixth century sculpture. Some hoplites wearing helmets may pull their hair back in this fashion.[14] but this is a special situation. A bronze statuette of a kouros in New York has a broad tail, which comes to a blunted point in the middle of his back.[15] The Dreros statue makes it highly likely not only that our statuette dates from the seventh century but also has an explicit connection with Crete. Most figures of the late seventh century have typical Daedalic hairstyles, which fall in broad steps to the shoulders, and this pointed tail links our statuette to an earlier tradition.

Most early figures, however, place their feet virtually side-by-side. With his advanced left leg, our statuette is among the few seventh century statuettes that take up the stance used by kouros of ca. 600 and after. The advanced left leg, however, is not unknown in earlier times; it can be seen in the famous bronze kouros statuette from Delphi of about 630.[16] and an elongated warrior from Olympia of about 650.[17]

Among statuettes of the early sixth century, those associated with the eastern Greek world have the closest relationship to this figure. Statuettes at Delphi [18] and Samos [19] have rather square shoulders and a schematic chest in which the pectorals are barely suggested and the navel and nipples are not indicated. Noses and lips are rather doughy, and no swellings mark the cheekbones in the piece at Delphi. The Samos figure has ears forming a beta pattern. The present statuette, however, is much more elongated, and his close-set eyes are more bizarre. He clearly belongs to both a different geographic setting and time frame.

The connections with both Crete and the Peloponnese seen in our statuette fit well

into the artistic world of ca. 600. Cretan sculptors were said by the Roman writer Pausanias to have been the teachers of the Laconian sculptors who executed major commissions at Olympia in the early sixth century.[20] It is, however, virtually certain that this statuette was not made in Crete, since male figures there were never nude in this period.[21] Cretans were credited with originating the custom of nudity and passing the tradition on to Sparta,[22] but nudity in art was evidently not part of this legacy. Wherever it was found, it seems likely that the statuette was a product of the Peloponnesian disciples of Cretan sculptors, and Olympia would be a good place for their interaction. The special hairstyle, furthermore, suggests that Cretan fashions may have followed along with artistic influence.

This statuette thus represents an extraordinary and scantily documented moment of transition from the characteristic stylized and simplified renderings of the human figure that prevailed during most of the seventh century to the kouros of Archaic times. In this statuette, post-Geometric art is in the process of becoming better proportioned, more articulated, and taking on the subtle animation of middle Archaic kouros.

268. **ROMAN MARBLE TORSO OF HERCULES.** Flavian to Trajanic Period, ca. 80-120 AD. This beautifully modeled torso depicts the nude body of Hercules, the hero of Greek and Roman mythology. The well muscled body is tilted slightly to the right and there are remnants of the fur of the Nemean Lion on the left side. The piece has extensive root marks and other earthen encrustation. This is an excellent example of Roman Period sculpture in a smaller size for a desk or a table. In 46 years of business, this is one of the most beautiful marble torsos we have handled. Mounted on muted yellow marble base. H. 9 1/8" (23 cm) and 11 3/4" (30 cm) with base.....65,000
269. **ROMAN BRONZE LABORS OF HERCULES TRIPOD.** ca. 2nd Century AD. From a northern European province. The three vertical legs are engraved with panels bearing a geometric floral pattern. The front leg is further distinguished by a sculpture of a triton bearing a branch of coral and preparing to throw a rock. This is surmounted by a figure of Winged Victory bearing a palm branch and laurel wreath. The transverse supports are delicately engraved with plant motifs and secured with conical pivot points. The legs of the tripod terminate in removable lion's foot bases. The tops of the tripod legs are decorated by three removable bronze sculptures of Hercules in three of his labors. On one he struggles with the Arcadian stag, an animal with golden antlers and brazen hooves. Hercules had to chase the animal for a year before he could capture it. The base of the sculpture bears a hook so that the tripod could be adorned with floral garlands. The sculpture is complete except for the loss of Hercules' club and a foreleg of the stag. The second sculpture depicts Hercules in conflict with the Cretan bull, which had once ravaged that island. The sculpture is complete except for the loss of the hook on the base. The third shows Hercules capturing one of the horses of Diomedes, animals trained to eat human flesh. The sculpture is complete except for the loss of Hercules' right arm and the hook on the base. All sculptures are executed in the style common to the best northern provincial bronzes. The sculptures have been cast and then chased to add fine details and delineated muscles and bodily features. They represent at once both the world of sophisticated Greco-Roman iconography and the vigor of provincial art, which followed standard iconography without loss of originality and feeling. The tripod can be disassembled and is fully collapsible, indicating it was not intended for permanent installation, but rather for transport. That suggests it was either employed for a periodic festival celebrating Hercules or, more likely, belonged to a military unit such as an auxiliary cohort or ala, dedicated to Hercules. As such the tripod could be packed and transported by mule or wagon and quickly set up wherever camp was established. The tripod would originally have borne a bronze fire bowl into which incense could be cast in sacrifice. Two feet of the tripod and some areas of the Hercules sculptures are plastic repairs. 270. **ROMAN COLOSSAL BRONZE TORSO.** ca. 3rd Century AD. This torso of a muscular nude male is over life size. At a height of 31" (and a width 22 1/4"), it is proportioned to a complete figure roughly 7 feet tall. The powerful impression created by the figure is a matter of presentation as well as size; the main features of the anatomy are articulated in forceful terms. The pectorals swell, the waist is sharply pulled in below the rib cage, the external obliques bulge out over the hips, and the muscles of the belly are set off clearly. The linea alba and the indentation below the proper right side of the rib cage are deeply indented. The surface modeling of the torso may originally have been quite restrained. The ribs, for example, are indicated only with subtle undulations. The lower part of the belly is flat and the navel is defined in dry and linear terms. Several features, such as the veins running through the external obliques, are articulated with special care. Particularly attractive is the chiseled finishing of the pubic hair, which forms a rich, complex tangle. The torso presents much evidence of the elaborate procedure necessary to produce a large lost-wax casting. Many casting flaws were plugged with small bronze squares, some of which have fallen

out over the centuries. Two larger casting flaws have cast-on repairs.

A striking feature of the torso is the strong inclination of the pectorals, which slope downward from left to right. This inclination is balanced a slope of the pelvis in the opposite direction. This strong contrast of axes and the large, firmly convex pectorals indicate that the composition was based on the art of the Greek sculptor Polykleitos, who was active in the second half of the fifth century B.C. and whose works were a major influence throughout the rest of Classical antiquity. In Polykleitos' famous and often-copied compositions, the Diskophoros, the Doryphoros (fig. 1), Herakles, and the Diadoumenos, musculature was more powerfully articulated than in the work of any other Classical sculptor, and, as here, tilting axes in chest and pelvis were strikingly evident. In his elaborately balanced system for articulating the athletic male body (commonly called "contrapposto"), the pelvis was higher on the side of the weight-bearing leg and sloped down toward the relaxed leg. As here, the weight-bearing leg was always the right. Correspondingly, the shoulders of Polykleitan statues took a pronounced counter tilt, sloping downward toward the weight-bearing side.

In spite of similarities in basic conception, it seems unlikely that the torso belonged to a replica of one of the statues of Polykleitos. First, no full-size replicas in bronze are known. Second, the articulation of the belly muscles here does not correspond exactly to Polykleitan prototypes. The linea alba does not continue down to the navel, and a waistline does not continue across the front of the figure, as in replicas of the works of Polykleitos. The scale might also be somewhat larger than any known replica. Furthermore, the left arm of this torso may have been in a raised position, judging by the relatively small, high gap where it was broken away. Except for the Diadoumenos (an athletic male – probably Apollo – who raised both arms to bind a ribbon around his head), Polykleitan statues had their arms in a lowered position. This torso seems more likely to belong to the realm of Roman bronze statues of emperors and major paternal gods, which could reach seven feet ten inches, as in the case of the Claudius from Herculaneum and the "Trebonianus Gallus", in the Metropolitan Museum, New York. Such statues are, of course, extremely rare as well.

If the original left arm of this torso was raised, as appears likely, the composition should be interpreted as a nude Zeus or Jupiter holding a long scepter with his raised left hand. The image appears frequently in both Hellenistic Greek and Roman Imperial numismatics (fig. 2). Roman statuettes also give an idea of the composition; a statuette formerly in the Fleischman collection shows a Polykleitan image of the nude Jupiter with left arm raised (fig. 3). In monumental scale, however, the image is much more impressive and commanding.

It is not impossible that this torso originally had a portrait head and represented a Roman emperor as the king of the gods. Emperors were often represented as Jupiter wrapped in a mantle. At times they were also portrayed as the nude Jupiter. A relevant case is provided by a life-size bronze statue of Lucius Verus (161-180 A.D.) in the Levy-White collection from Burdur, Turkey (fig. 4). The emperor's head is a realistic portrait, but his nude body is idealized and muscular. The pose and conception are generally similar to this torso, although Verus' pectorals are not as massively Polykleitan and his right (rather than left) arm is raised. The Berk torso also seems to be at a somewhat larger scale.

The back of the torso has a dynamic curvature, but its simple rendering makes it evident that it was meant to be placed against a wall or in a niche, a kind of display characteristic of Roman Imperial times. Since the nipples are cast together with the rest of the body, it is likely that the sculpture was produced no earlier than the second century A.D.; in earlier times nipples were often inlaid with copper. Most replicas of Polykleitan statues date no later than the second century. One feature, however, suggests that this particular derivative of Polykleitan style might be later and stem from Severan times. The elaborate and beautiful chiseling of the pubic hair resembles the treatment of beards in portraits of Macrinus (217-218 A.D.) in Belgrade, Serbia (fig. 5) and Alexander Severus (222-235 A.D.) from Camunum (fig. 6), Austria. The comparison with the latter is particularly close, since in these two cases, the hair is not indicated with locks cast in relief but is rendered entirely with chiseling. A date in the range of 217-227 thus seems possible.

In any case, the torso represents a rare (if not unique) example of a highly Polykleitan conception of male anatomy in bronze on a monumental scale. In ancient Greek eyes, the unadorned but highly trained physique represented an ideal that should be sought by all male citizens. Such ideal images also embodied the prowess of the greatest gods and the semi-divine rulers of the Roman Empire. The glamorous and almost swaggering version of the athletic male ideal created by Polykleitos, is here interpreted in bronze in commanding, public terms.
